**Problem** – Everyone has to pay taxes and a number of them. Sometimes people aren't aware of the calculation of the tax that they are paying, they just simply pay the amount specified to them as tax.

Sometimes there are middle men involved in the payment of taxes and they trick people to pay more amount than that is required and people still go through these middle men to pay their taxes because they don't have that much time.

The government also suffers sometimes from cases such as of tax evasions.

These problems are still there due to the unavailability of a platform for tax calculation and management.

**Solution** – Our team has come up with an online platform as a solution to this problem.

**Tick Tax** is a tax calculation and management system through which any person can manage his or her tax returns much more efficiently.

The purpose of tick tax, at a national level, is to calculate and inform the person about his/her income tax and wealth tax, saving them from any delayed tax payment resulting in fine and other problems such as paying extra fee to middle-men. People can also see and avail different schemes released by government for them.

This platform will give rewards to people for successful payment of their taxes, to inspire others to do the same.

The government can also keep a check on the people who have paid their dues and who haven't, saving the government from tax evasions also.
